

3GPP TS 33.369 V19.3.0 (2026-06)

Technical Specification

3rd Generation Partnership Project; Technical Specification Group Services and System Aspects; Security aspects of Ambient Internet of Things (AIoT) services for isolated private networks (Release 19)

The present document has been developed within the 3rd Generation Partnership Project (3GPP™) and may be further elaborated for the purposes of 3GPP. The present document has not been subject to any approval process by the 3GPP Organizational Partners and shall not be implemented. This Specification is provided for future development work within 3GPP only. The Organizational Partners accept no liability for any use of this Specification. Specifications and Reports for implementation of the 3GPP™ system should be obtained via the 3GPP Organizational Partners' Publications Offices.

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

In the present document, modal verbs have the following meanings:

- shall** indicates a mandatory requirement to do something
- shall not** indicates an interdiction (prohibition) to do something

The constructions "shall" and "shall not" are confined to the context of normative provisions, and do not appear in Technical Reports.

The constructions "must" and "must not" are not used as substitutes for "shall" and "shall not". Their use is avoided insofar as possible, and they are not used in a normative context except in a direct citation from an external, referenced, non-3GPP document, or so as to maintain continuity of style when extending or modifying the provisions of such a referenced document.

- should** indicates a recommendation to do something
- should not** indicates a recommendation not to do something
- may** indicates permission to do something
- need not** indicates permission not to do something

The construction "may not" is ambiguous and is not used in normative elements. The unambiguous constructions "might not" or "shall not" are used instead, depending upon the meaning intended.

- can** indicates that something is possible
- cannot** indicates that something is impossible

The constructions "can" and "cannot" are not substitutes for "may" and "need not".

- will** indicates that something is certain or expected to happen as a result of action taken by an agency the behaviour of which is outside the scope of the present document
- will not** indicates that something is certain or expected not to happen as a result of action taken by an agency the behaviour of which is outside the scope of the present document
- might** indicates a likelihood that something will happen as a result of action taken by some agency the behaviour of which is outside the scope of the present document

might not indicates a likelihood that something will not happen as a result of action taken by some agency the behaviour of which is outside the scope of the present document

In addition:

is (or any other verb in the indicative mood) indicates a statement of fact

is not (or any other negative verb in the indicative mood) indicates a statement of fact

The constructions "is" and "is not" do not indicate requirements.

1 Scope

The present document specifies the security and privacy aspects of AIoT services in the 5G System (5GS), complying to the requirements in TS 22.369 [4], applicable to the AIoT Device types, traffic types, use cases and connectivity topologies defined in TS 38.300 [3], and based on the architecture defined in TS 23.369 [2].

The AIoT system is defined as private network, i.e. isolated network deployment that does not interact with a public network, e.g. an SNPN.

Security features for AIoT services include:

1. Network Layer Authentication between AIoT device and 5G core

- a. AIOTF is the endpoint in the 5G core

- b. Credentials are securely stored in the ADM on the network side

NOTE 1: The credentials are assumed to be stored in a secure environment in the ADM. How this is realized is left to implementation. The requirements will reflect this.

- c. Secure storage and processing of credentials in the AIoT device.

NOTE 2: Void

- d. Security aspects of the storage of the credentials at the ADM

2. Confidentiality, anti-replay and integrity protection of information during AIoT service communication

3. Privacy of AIoT device identifiers using the AIoT temporary identifier.

4. Security to protect the permanent disabling RF transmission capabilities of AIoT device(s).

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

3 Definitions of terms, symbols and abbreviations

3.1 Terms

For the purposes of the present document, the terms given in TR 21.905 [1] and the following apply. A term defined in the present document takes precedence over the definition of the same term, if any, in TR 21.905 [1].

AIoT Device: as specified in TS 23.369 [2].

3.2 Symbols

Void

3.3 Abbreviations

For the purposes of the present document, the abbreviations given in TR 21.905 [1] and the following apply. An abbreviation defined in the present document takes precedence over the definition of the same abbreviation, if any, in TR 21.905 [1].

ADM	AIoT Data Management
AIoT	Ambient Internet of Things
AIOTF	Ambient IoT Function
D2R	Device to Reader
R2D	Reader to Device

4 Security requirements for AIoT service

4.1 General

Two functional cases are supported: inventory, command.

The AIoT RAN reader is assumed to be trusted, i.e., authorized from network side to communicate with the AIoT device.

4.2 Security Requirements

4.2.1 Requirements on the device

4.2.1.1 Secure storage and processing of credentials

The long-term credentials used for authentication shall be securely stored and processed on the AIoT device.

The long-term credentials shall be protected against cloning when stored or processed.

The long-term credentials shall be confidentiality and integrity protected when stored and processed.

In the present document, the AIoT system is defined as private network (isolated network deployment that does not interact with a public network) e.g. SNPN, and the AIoT device credentials storage follows 3GPP defined requirements, the exact mechanism is out of scope of 3GPP (similar to Annex I.2.2 of TS 33.501 [5]). This means that no interconnection exists between AIoT systems and PLMNs.

NOTE 1: In case UICC is used, the exact form factor and whether it is removable, non-removable or integrated is out of scope of 3GPP.

NOTE 2: UICC provides protection for long-term credentials against physical and logical attacks.

4.2.1.2 Requirements related to authentication between device and network

The AIoT device shall support:

- a method for pseudo-random bit generation.

4.2.1.3 Requirements for command protection

The AIoT device shall support confidentiality protection of AIoT NAS messages between the AIoT device and the AIOTF.

Confidentiality protection of AIoT NAS messages between the AIoT device and the AIOTF is optional to use.

The AIoT device shall support the following ciphering algorithms:

NEA0 and 128-NEA2 as specified in Annex D of TS 33.501 [5].

The AIoT device shall support integrity protection and replay protection of AIoT NAS messages between the AIoT device and the AIOTF.

Integrity protection of AIoT NAS messages between the AIoT device and the AIOTF is mandatory to use.

The AIoT device shall support the following integrity algorithms:

128-NIA2 as specified in Annex D of TS 33.501 [5].

4.2.1.4 Requirements for identifier privacy

- The device shall support a mechanism for the use of temporary IDs.

4.2.2 Requirements on the AIOTF

4.2.2.1 Requirement on Authentication

The AIOTF shall authenticate the AIoT device.

4.2.2.2 Requirements on Communication Protection

The AIOTF shall support confidentiality protection of AIoT NAS Command request and response between the AIoT device and the AIOTF.

The AIOTF shall support the following ciphering algorithms:

NEA0, 128-NEA2 as defined in Annex D of the TS 33.501 [5].

Confidentiality protection of AIoT NAS Command request and response between the AIoT device and the AIOTF is optional to use.

The AIOTF shall support integrity protection of AIoT NAS Command request and response between the AIoT device and the AIOTF.

The AIOTF shall support the following integrity algorithms:

128-NIA2 as defined in Annex D of the TS 33.501 [5].

Integrity protection of AIoT NAS Command request and response between the AIoT device and the AIOTF is mandatory to use.

The AIOTF shall support selection of confidentiality and integrity algorithms for protecting AIoT NAS Command request and response between the AIoT device and the AIOTF based on operator's local policy.

4.2.2.3 Requirements on Privacy

The AIOTF shall support a mechanism for the use of temporary IDs and it is optional for network to use.

4.2.3 Requirements on the ADM

For network layer authentication between AIoT device and 5G core, credentials shall be securely stored in the ADM. In case of SNPN, AIoT device credential can be stored in the credential holder instead of ADM.

NOTE: Security mechanisms for storage of AIoT device credentials in the ADM are left to implementation.

4.2.4 Security Requirements on the NG-RAN

AIOT2 is the reference point between the AIOTF and the NG-RAN.

NG-RAN shall support the use of integrity, confidentiality and replay protection with the AIOTF over the AIOT2 interface.

5 Security procedures for Ambient IoT service

5.1 General

This clause describes the security procedures for Ambient IoT service. The requirements can be found in clause 4.

5.2 Authentication procedure

5.2.1 General

This clause describes the authentication procedure for Ambient IoT devices for both Inventory procedure and Command procedure when authentication is triggered by the network. Device authentication shall always be performed for the Inventory Procedure.

NOTE: $K_{\text{AIoT_root}}$ is the long-term key.

5.2.2 Authentication procedure

The authentication procedure is aligned with inventory procedure and command procedure in 6.2.2 and 6.2.3 of TS 23.369[2].

Figure 5.2.2-1: Authentication procedure

0. Step 1-3 of clause 6.2.2 for the inventory procedure or clause 6.2.3 for the command procedure in TS 23.369 [2] is performed.

1 a-c. AIOTF shall invoke Nadm_SecRAND_Get service operation towards ADM. ADM shall generate and return $RAND_{\text{AIOT_n}}$ towards AIOTF.

1d. Step 5-6 of clause 6.2.2 for the inventory procedure or clause 6.2.3 for the command procedure in TS 23.369 [2] is performed.

2. AIOTF shall send an Inventory Request message including $RAND_{\text{AIOT_n}}$ in addition to the AIoT Identification Information specified in clause 31.7 of TS 23.003 [8] to NG-RAN.

3. NG-RAN shall include $RAND_{\text{AIOT_n}}$ in the paging message to the AIoT Device in addition to the AIoT Identification Information.

NOTE 1: An active attack may send a new paging message to the AIoT Device while there is an ongoing procedure in the AIoT Device. The AIoT Device will abort the ongoing procedure and respond to the new paging message. The security measure to such Denial-of-Service attack is not specified in present document.

NOTE 2: While a legitimate network is performing an inventory operation, an attacker may cause amplification of resource exhaustion at the legitimate network side by sending AIoT paging messages for all AIoT Devices or to a large group of AIoT Devices, which causes large number of AIoT Devices sending D2R messages to the legitimate network that the legitimate network does not expect to receive. The security measure to such amplification of resource exhaustion attack is not specified in present document.

4. Upon receiving the paging message, if the AIoT Device determines it needs to respond based on the AIoT Device Identification Information, the AIoT Device shall generate a pseudo-random number $RAND_{AIOT_d}$, calculate RES_{AIOT} using K_{AIoT_root} , $RAND_{AIOT_n}$, and $RAND_{AIOT_d}$ (see Annex A.2) for network authenticating the AIoT Device.
5. AIoT Device shall send a D2R message including an AIOT NAS message to the NG-RAN. The AIOT NAS message includes RES_{AIOT} and $RAND_{AIOT_d}$.
6. NG-RAN shall send an Inventory Report message to AIOTF, including the AIOT NAS message containing RES_{AIOT} and $RAND_{AIOT_d}$.
7. AIOTF shall invoke `Nadm_SecAuthentication_Get` service operation with the AIoT Device Identification Information, $RAND_{AIOT_n}$, and $RAND_{AIOT_d}$ towards ADM.

NOTE 3: The authentication is expected to be run more often than normal UE, (e.g., during each inventory procedure), which has load impact on the ADM.
8. ADM shall calculate $XRES_{AIOT}$ using the same method as in AIoT Device (see Annex A.2).
9. ADM shall return $XRES_{AIOT}$ and AIoT Device Permanent Identifier if not included in step 7 to AIOTF.
10. AIOTF shall verify RES_{AIOT} .
11. If the verification is successful, for command case, the AIOTF shall invoke `Nadm_SecSessionKey_Get` service operation with AIoT Device Permanent Identifier, $RAND_{AIOT_n}$, and $RAND_{AIOT_d}$ towards ADM. ADM shall calculate and return K_{AIOTF} if it receives a request from AIOTF (see AnnexA.3).

The steps 12-14 in clause 6.2.2 for inventory procedure or the step 8-11 of clause 6.2.3 for command procedure in TS 23.369 [2] continue.

For the command procedure, the AIoT device implicitly authenticates the network via integrity check of the AIOT NAS Command Request message as specified in clause 5.3.2 of present document.

5.3 Protection of information during AIoT service communication

5.3.1 General

This clause describes the security procedures for the information protection in command message. The protection of information is provided as part of the AIoT NAS protocol between AIoT device and AIOTF. The AIOTF acts as the security termination point for AIoT information protection.

5.3.2 Security procedure on information protection during command procedure

Figure 5.3.2-1: Security procedure on the information protection during command procedure

1. The command procedure is initiated as specified in step 1-6 of clause 6.2.3 of TS 23.369 [2].
2. The procedure as described in clause 5.2.2 shall be performed. The device and AIOTF acquire the K_{AIOTF} key to be used for command protection. The derivation of K_{AIOTF} key is specified in Annex A.3.

3. The AIOTF shall construct a AIOT NAS Command Request and protect the message based on the $K_{Command_enc}$, $K_{Command_int}$, and the confidentiality and integrity algorithms for the AIoT device. The AIOTF shall send the protected AIOT NAS Command Request containing an indication on whether cyphering is activated or not to NG-RAN. The derivation of $K_{Command_enc}$ and $K_{Command_int}$ is specified in Annex A.4. The cyphering indication shall only be integrity protected.

NOTE 1: The whole AIOT NAS Command Request message is integrity protected. If cyphering is activated (i.e., the cyphering algorithm is 128-NEA2), the AIOT NAS Command Request message is partly cyphered with the cyphering indication remaining in clear text.

4. The NG-RAN shall send a R2D message containing the protected AIOT NAS Command Request as specified in TS 38.300 [3] and TS 38.391 [6].

NOTE 1a: It is left to implementation when K_{AIOTF} is derived on the device.

5. The AIoT device shall derive the $K_{Command_enc}$, $K_{Command_int}$ and process the protected AIOT NAS command Request. If the verification of integrity is successful, the AIoT device shall decipher the protected AIOT NAS Command Request if cyphering is activated. The AIoT device shall construct an AIOT NAS Command

Response and protect it based on the derived key(s) and the received indication on whether ciphering is activated or not.

6. The AIoT device shall send a D2R message containing the protected AIOT NAS Command Response to the NG-RAN as specified in TS 38.300 [3] and TS 38.391 [6].
7. The NG-RAN shall forward the protected AIOT NAS Command Response to the AIOTF.
- 8-9. The AIOTF shall process the protected AIOT NAS Command Response. If the verification of integrity is successful, the AIOTF shall decipher the protected AIOT NAS Command Response if ciphering is activated. Then, the AIOTF shall continue the procedure as specified in clause 6.2.3 of TS 23.369 [2].

NOTE 2: It is assumed that there is only one round of command procedure per device following an inventory procedure. Since the K_{AIOTF} key is fresh, there is no need for additional freshness parameters for replay protection.

NOTE 3: It is assumed that in the present document no new algorithms will ever be introduced for information protection during command procedure.

5.3.3 Input and output parameters to integrity algorithm

The input parameters to the integrity algorithm as described in Annex D.3 in TS 33.501[5] shall be set as follows.

The KEY input is equal to the $K_{\text{Command_int}}$ key.

The MESSAGE is set to the content of AIOT NAS Command Request or AIOT NAS Command Response.

The DIRECTION bit is set to 0 for uplink and 1 for downlink.

The BEARER is set to all zeros.

The COUNT is set to all zeros.

The output is a 32-bit message authentication code used for integrity verification.

5.3.4 Input parameters to ciphering algorithm

The input parameters for the ciphering algorithms shall be the same as the ones used for NAS integrity protection as described in clause 5.3.3, with the exception that there is an additional input parameter, namely the length of the key stream to be generated by the ciphering algorithms and the KEY input is equal to the $K_{\text{Command_enc}}$ key.

5.4 Protection of AIoT Device identifier privacy

5.4.1 General

This clause describes the mechanisms to protect AIoT Device identifier privacy during the inventory procedure. The mechanism is based on the use of a Temporary ID (i.e., T-ID). The T-ID is generated based on the key (i.e., $K_{\text{AIoT_root}}$) shared between AIoT Device and ADM. Depending on the situation and deployment scenario, the network operator can choose which paging procedure to use.

When privacy protection is not used during the inventory procedure, the T-ID is not used. The AIoT Device includes its AIoT Device Permanent Identifier as a device identification information in the procedure specified in clause 5.2.2.

5.4.2 The AIoT Device Identifier protection for inventory with filtering information

For the protection of AIoT Device Permanent Identifier during the inventory procedure described in clause 5.2.2, the following change shall apply:

- In step 4, the AIoT Device determines it needs to reply to the NG-RAN based on the received filtering information.

NOTE 1: The attacker may obtain an AIoT Device ID by performing a bitwise enumeration in multiple paging messages. To mitigate the attack, the AIoT Device need to be configured with filtering information to match by limiting which bits of AIoT Device Identifier is allowed for filtering information (guidance would be to limit to the leftmost n bits of the AIoT Permanent Device Identifier, e.g., only allow filtering information for the leftmost 64 bits and not respond otherwise).

- In steps 5 and 6, the AIoT Identification Information is not included in the D2R message and Inventory Report message.
- In step 7, Filtering Information is used as the AIoT Identification Information.
- In step 9, ADM shall send the AIoT Device Permanent Identifier corresponding to $XRES_{AIOT}$ to AIOTF.

NOTE 2: The AIOTF identifies the AIoT device by checking the received RES_{AIOT} . Therefore, AIoT Device Identification Information is not needed in the D2R and Inventory Report message.

NOTE 3: When inventory with filtering information is used, after receiving the D2R message, the ADM has to exhaustively derive $XRES_{AIOTS}$ with all the long-term keys (i.e., K_{AIOT_root}) of the AIoT devices in the group that was paged for every $RAND_{AIOT_d}$ received. The AIOTF then, need to check $XRES_{AIOT}$ with the received RES_{AIOT} . Therefore, the size of the group should be chosen accordingly to reduce the energy consumption, inter NF interaction, and latency.

5.4.3 Procedure for AIoT Device Identifier protection with T-ID update during Individual inventory

For the protection of AIoT device permanent identifier during the inventory procedure with AIoT Device Identifier described in clause 5.2.2, the following changes shall apply:

- In step 1, AIOTF shall invoke `Nadm_SecTID_Get` service operation to retrieve a T-ID (T_ID_n) in addition to the $RAND_{AIOT_n}$ from ADM using the AIoT Device Permanent Identifier. The ADM shall, based on T-ID handling information stored in the AIoT device profile, either fetch the stored T-ID in the AIoT Device profile or generate the T-ID based on the AIoT Device Permanent Identifier as specified in Annex B.1, and send the T-ID to the AIOTF.
- In steps 2, 3, and 4, the T-ID shall be used as the AIoT Identification Information.
- In step 2 the AIOTF includes the T-ID handling information in the Inventory Request message. T-ID handling information includes:
 - T-ID type that can be either a concealed type or a stored type. If the T-ID type is the concealed type, the T-ID is generated based on the AIoT Device Permanent Identifier. If the T-ID is the stored type, the T-ID is generated based on the stored T-ID as specified in Annex B.1.
 - Whether the stored T-ID is updated with a command via a Command procedure or without a command during step 4.

NOTE A: If the T-ID is of stored type, the initial value of the T-ID is to be computed based on the AIOT Device Permanent ID.

- In step 3, NG-RAN includes the T-ID handling information in the paging message.
- In step 4, the AIoT device, based on the T-ID handling information in the paging message, generates the T-ID in the same way as the ADM did in step 1 if the T-ID type is concealed type, or retrieves the T-ID if the T-ID type is stored type. The AIoT device determines it needs to reply to the NG-RAN if the generated or retrieved T-ID matches the received T-ID. In case the stored T-ID update shall be done without a command, the AIoT Device generates a new T_ID_n+1 as specified in Annex B.1 and stores the new T_ID_n+1 as T_ID_n .
- In steps 5 and 6, the AIoT Identification Information is not included in the D2R message and the Inventory Report message.
- In step 7, the AIoT Device Permanent Identifier is used as the AIoT Identification Information.
- In step 10, if the verification of RES_{AIOT} is successful and if the T-ID type is stored type, then AIOTF shall instruct the ADM with a `Nadm_SecTID_Update` service operation to derive a new T-ID (T_ID_n+1) as specified

in Annex B.1 and to store it as T-ID_n in the AIoT Device profile. If the T-ID is to be updated by command, the AIOTF shall also obtain the newly derived T-ID from the ADM.

NOTE 1: The AIOTF identifies the AIoT Device by checking the received RES_{AIoT} parameter. Therefore, the AIoT Identification Information is not needed in the D2R message and the Inventory Report message.

NOTE 2: In case of concealed T-ID type, every AIoT Device that receives an Inventory Request with T-ID needs to perform a T-ID matching by generating a T-ID based on the K_{AIoT_root} and check if the generated T-ID matches the received T-ID. It is assumed that the AIoT Device that receives the Inventory Request has enough energy to perform this T-ID matching in addition to the Inventory procedure specified in clause 5.2.2.

NOTE 3: In the case of stored T-ID type, the stored T-IDs on the device side and network side can get out of synch. The handling of such situation is described in clause 5.4.4.

NOTE 4: When the T-ID is updated using the command procedure, protection of AIoT device identifier privacy is only realized if the Command Request is encrypted using NEA2.

- After step 10, if the stored T-ID update is performed via a Command procedure, the AIOTF sends an encrypted AIOT NAS Command Request message containing the new T-ID requested from the ADM to the AIoT Device. Upon receipt of the Command Request message, the AIoT Device stores the new T-ID.

5.4.4 Out-of-Synch detection and Resynchronization of T-ID

In case the network does not receive an Inventory Response from an AIoT Device after an Individual Inventory Request, it may occur because that the AIoT Device and the network are out of synch with the T-IDs. The out-of-synch can happen if e.g.:

- The Inventory Response or Command Response from the Device was lost during transmission due to radio link issues e.g. interference, range, etc. in that case the AIoT Device would generate the T-ID_{n+1}, but the ADM would not generate the T-ID_{n+1} or not know that the device has received the T-ID_{n+1} as it did not get any response.
- Something went wrong during the Inventory or Command procedure e.g., the AIoT Device managed to write to the NVM but not send the inventory response or command response, or the AIoT Device sent the inventory response or command response but was not able to write to the NVM.

If the AIOTF performed Individual Inventory with the stored T-ID and did not receive the response from the AIoT device, the AIOTF invokes Nadm_SecTID_Get service operation with Resynchronization indicator and the RAND_{AIOT_n} to indicate T-ID sequence recovery to the ADM, and retrieves the T-ID of the concealed T-ID type from the ADM. Then, the AIOTF performs Individual Inventory to the AIoT device with the concealed T-ID. The AIOTF may use the command request message to update the stored type T-ID with a new T-ID in the device. The AIOTF requests the ADM to update the T-ID and retrieves this T-ID from the ADM. After the successful command procedure, the T-IDs in the device and the ADM are in sync.

Editor's Note: The T-ID update service operation is to be updated.

5.5 Protection between AIoT network elements

For the interfaces specified in clause 4.3 of TS 23.369 [2], the security procedures specified in clause 13 in TS 33.501 [5] applies to the service-based interfaces within 5G core network for Ambient IoT. The mechanism described in clause 12.3 of TS 33.501 [5] applies to the NEF-AF interface.

The security mechanism specified for N2, between 5G-AN and AMF defined in clause 9.2 of TS 33.501 [5], applies to the AIOT2 interface between AIOTF and NG-RAN.

5.6 Protection of the disabling RF transmission capabilities

For the protection of the permanent disabling RF transmission capabilities of AIoT device(s), the security procedure for the information protection in clause 5.3 in the present document applies to the protection of the disabling messages.

6 Security related services

6.1 Services provided by ADM

6.1.1 General

The following table shows the Nadm_Sec service and Service Operations related to AIoT security.

Table 6.1.1-1: List of ADM Services

Service Name	Service Operations	Operation Semantics	Example Consumer(s)
Nadm_Sec	RAND_Get	Request/Response	AIOTF
	Authentication_Get	Request/Response	AIOTF
	SessionKey_Get	Request/Response	AIOTF
	TID_Get	Request/Response	AIOTF
	TID_Update	Request/Response	AIOTF

6.1.2 Nadm_SecRAND_Get service operation

Service operation name: Nadm_SecRAND_Get.

Description: Requester NF gets the $RAND_{AIOT_n}(s)$ from ADM.

Input, Required: None.

Input, Optional: None.

Output, Required: $RAND_{AIOT_n}$.

Output, Optional: None.

6.1.3 Nadm_SecAuthentication_Get service operation

Service operation name: Nadm_SecAuthentication_Get.

Description: Requester NF gets the authentication data from ADM.

Input, Required: $RAND_{AIOT_d}(s)$, $RAND_{AIOT_n}$.

Input, Optional: AIoT Device Permanent Identifier or filtering information.

Output, Required: $XRES_{AIOT}(s)$.

Output, Optional: AIoT Device Permanent Identifier(s) .

6.1.4 Nadm_SecSessionKey_Get service operation

Service operation name: Nadm_SecSessionKey_Get.

Description: Requester NF gets the K_{AIOTF} from ADM.

Input, Required: AIoT Device Permanent Identifier, $RAND_{AIOT_n}$, $RAND_{AIOT_d}$.

Input, Optional: None.

Output, Required: K_{AIOTF} .

Output, Optional: None.

6.1.5 Nadm_SecTID_Get service operation

Service operation name: Nadm_SecTID_Get.

Description: Requester NF gets the Temporary ID (T-ID) for a given AIoT device from ADM.

Input, Required: AIoT Device Permanent ID.

Input, Optional: Resynchronization indicator, RAND_{AIOT_n}

Output, Required: T-ID, T-ID handling type.

6.1.6 Nadm_SecTID_Update service operation

Service operation name: Nadm_SecTID_Update.

Description: Requester NF initiates the generation of a new Temporary ID (T-ID_{n+1}) for a given AIoT device in the ADM.

Input, Required: AIoT Device Permanent ID, RAND_{AIOT_n}.

Input, Optional: None.

Output, Required: T-ID_{n+1}

Output, Optional: None.

Annex A (normative): Key derivation functions

A.1 KDF interface and input parameter construction

A.1.1 General

All key derivations (including input parameter encoding) for 5GC shall be performed using the key derivation function (KDF) specified in Annex B.2.0 of TS 33.220 [7].

This clause specifies how to construct the input string, S , and the input key, KEY , for each distinct use of the KDF. Note that "KEY" is denoted "Key" in TS 33.220 [7].

A.1.2 FC value allocations

The FC number space used is controlled by TS 33.220 [7], FC value allocated for the present document is 0x8F-0x92.

A.2 RES_{AIOT} and $XRES_{AIOT}$ derivation function

When deriving a RES_{AIOT} and $XRES_{AIOT}$ from K_{AIOT_root} (of at least 128 bit length), the following parameters shall be used to form the input S to the KDF:

- $FC = 0x8F$,
- $P0 = RAND_{AIOT_n}$,
- $L0 = \text{length of } RAND_{AIOT_n} \text{ (i.e. } 0x00 \text{ } 0x10)$,
- $P1 = RAND_{AIOT_d}$.
- $L1 = \text{length of } RAND_{AIOT_d} \text{ (i.e. } 0x00 \text{ } 0x10)$,
- $P2 = \text{AIoT device permanent identifier}$,
- $L2 = \text{length of AIoT device permanent identifier}$,

The input key KEY shall be K_{AIOT_root} . The RES_{AIOT} and $XRES_{AIOT}$ are defined as the 64 least significant bits of the output of the KDF.

A.3 K_{AIOTF} derivation function

When deriving a 128-bit K_{AIOTF} from K_{AIOT_root} , the following parameters shall be used to form the input S to the KDF:

- $FC = 0x90$,
- $P0 = RAND_{AIOT_n}$,
- $L0 = \text{length of } RAND_{AIOT_n} \text{ (i.e. } 0x00 \text{ } 0x10)$,
- $P1 = RAND_{AIOT_d}$.
- $L1 = \text{length of } RAND_{AIOT_d} \text{ (i.e. } 0x00 \text{ } 0x10)$,

The input key KEY shall be the K_{AIOT_root} .

The K_{AIOTF} is identified with the 128 least significant bits of the output of the KDF.

A.4 $K_{\text{Command_enc}}$ and $K_{\text{Command_int}}$ derivation function

When deriving a 128-bit $K_{\text{Command_enc}}$ or 128-bit $K_{\text{Command_int}}$ from K_{AIOF} , the following parameters shall be used to form the input S to the KDF:

- FC = 0x91,
- P0 = algorithm type distinguisher as specified in Table A.4-1.
- L0 = length of algorithm type distinguisher (i.e. 0x00 0x01)

Table A.4-1: Algorithm type distinguishers

Algorithm distinguisher	Value
Encryption algorithm	0x01
Integrity algorithm	0x02

The input key KEY shall be the K_{AIOF} .

The $K_{\text{Command_enc}}$ / $K_{\text{Command_int}}$ is identified with the 128 least significant bits of the output of the KDF.

Annex B (normative): Temporary Identifier generation functions

B.1 T-ID generation

When generating a temporary identifier (i.e., T-ID) from $K_{\text{AIoT_root}}$, the following parameters shall be used to form the input S to the KDF:

- $\text{FC} = 0\text{x}92$,
- $\text{P0} = \text{T-ID}_n$ or AIoT device Permanent ID,
- $\text{L0} = \text{length of T-ID}_n$,
- $\text{P1} = \text{RAND}_{\text{AIoT}_n}$,
- $\text{L1} = \text{length of RAND}_{\text{AIoT}_n}$

The input key KEY shall be $K_{\text{AIoT_root}}$. The P0 input is either the stored T-ID_n or AIoT device Permanent ID. The T-ID is defined as the 128 least significant bits of the output of the KDF.

Annex C (informative): Change history

Change history						
Date	Meeting	TDoc	CR	Rev	Cat	Subject/Comment
2025/09	SA#109					Upgrade to change control version
2026-01	SA#110	SP-251526	0003	-	F	Clean up for TS 33.369
2026-01	SA#110	SP-251526	0004	1	F	Remove the EN in the scope
2026-01	SA#110	SP-251526	0008	-	F	Update the FC Value in 33.369
2026-01	SA#110	SP-251526	0017	4	F	AIoT correction to the authentication procedures
2026-01	SA#110	SP-251526	0020	4	F	Correction on privacy
2026-01	SA#110	SP-251526	0025	1	F	Update privacy general clause for privacy policy pre-configuration
2026-01	SA#110	SP-251526	0030	1	F	Editorial changes and resolution of remaining ENs
2026-01	SA#110	SP-251526	0035	1	F	New clause for security related services
2026-01	SA#110	SP-251526	0040	-	F	Add a new clause as the protection of the disabling messages
2026-01	SA#110	SP-251526	0051	-	F	Adding a NOTE in ID privacy of individual inventory in TS 33.369
2026-01	SA#110	SP-251526	0055	1	F	Addressing the missing information on the initial value of temporary identifier in Clause 5.4.3 and Annex B.
2026-01	SA#110	SP-251526	0056	4	F	Information protection during command procedure - corrections
2026-01	SA#110	SP-251526	0057	-	F	Add some abbreviations
2026-01	SA#110	SP-251526	0058	1	F	update T-ID in annex B and scope
2026-01	SA#110	SP-251526	0064	-	F	Removing the Editor's Note related to requirements of identifier privacy
2026-01	SA#110	SP-251526	0065	-1	F	Clarification of key lengths and length of RE/XRES
